

Message Boxes

A message box is used to display information, usually a question, to the user. It also allows the user make a decision by clicking on a button. The result is returned as a DialogResult enumeration.

You can customize the question and the number and type of buttons. There are many excellent tutorials that describe how to customise message boxes.

Try:

Example – To exit an application

You want to display a message box that asks the user if he wants to exit the application.

```
string message = "Do you want to exit the application?";
string caption = "My Application";
MessageBoxButtons buttons = MessageBoxButtons.YesNo;
DialogResult result = MessageBox.Show(message, caption, buttons);
if (result == DialogResult.Yes)
{
    Application.Exit();
}
```
